### Saada Tutorial

#### Introduction

Saada has been designed to help astronomers to build local archives by the simplest way. A Database created by Saada, a *SaadaDB*, can host multiple collections of heterogeneous data (spectra, catalogs images, spectra, flatfiles, miscellaneous) .

Meta-data extracted from input files (FITS or VOTables) are first stored into the database and then mapped to a common interface allowing consistent queries covering these heterogeneous datasets.

Data collections can be linked to each other with persistent relationships.

A *SaadaDB* comes with a rich Web interface automatically generated and managed.

Data collections can also be exposed through VO services (SCS, SIA, SSA or TAP).

An API is available for those who want to build their own Web interface or to feed another piece of software with data retrieved from the database.

A *SaadaDB* can be managed with a graphical tool or by script.

Although being enable to be operated automatically, the data loader can be configured by hand to extract the proper meta-data.

#### Software Requirements

- **Saada** works on either **MacOS**, **Windows** or **Linux**, all in 64 bits.
- **Oracle Java JDK** (1.7+) is required.
- **Saada** can run with **PostgreSQL**, **MySQL** or **SQLite**. This last option do not require any software or service installation (recommended for the session).
- The Web interface works with **Apache Tomcat 6+**. Tomcat must have R/W permission in the Saada repository.

- **Windows:** Make both following environment variables pointing on your JDK install (see *Advanced Settings*)
  - PATH
  - JAVA\_HOME

## Tutorial Steps

This tutorial proposes 11 steps. Some are compulsory and some others are optional:

1. Saada installation
2. Database creation
3. Loading catalogues and READMEs
4. Testing the Web interface
5. Loading images
6. Loading spectra
7. Linking catalogs and READMEs
8. Linking images, spectra and sources together
9. Publishing a simple service
10. Publishing a TAP service
11. Accessing the TAP service

The table below shows the dependencies between the different tasks.

To be achieved, each task (green cell) requires all task tagged in yellow on the same row to be completed in the right order.

	1	2	3	4	5	6	7	8	9	10	11
1 Saada installation	Green										
2 Database creation	Yellow	Green									
3 Loading catalogues and READMEs	Yellow	Yellow	Green								
4 Testing the Web interface	Yellow	Yellow	Yellow	Green							
5 Loading images	Yellow	Yellow	Yellow		Green						
6 Loading spectra	Yellow	Yellow	Yellow			Green					
7 Linking catalogues and READMEs	Yellow	Yellow	Yellow				Green				
8 Linking images, spectra and sources together	Yellow	Yellow	Yellow	Yellow	Yellow	Yellow		Green			
9 Publishing simple services	Yellow	Yellow	Yellow	Yellow	Yellow	Yellow			Green		
10 Publishing a TAP service	Yellow	Yellow	Yellow		Yellow	Yellow				Green	
11 Accessing the TAP service	Yellow	Yellow	Yellow		Yellow	Yellow				Yellow	Green

## Saada Installation

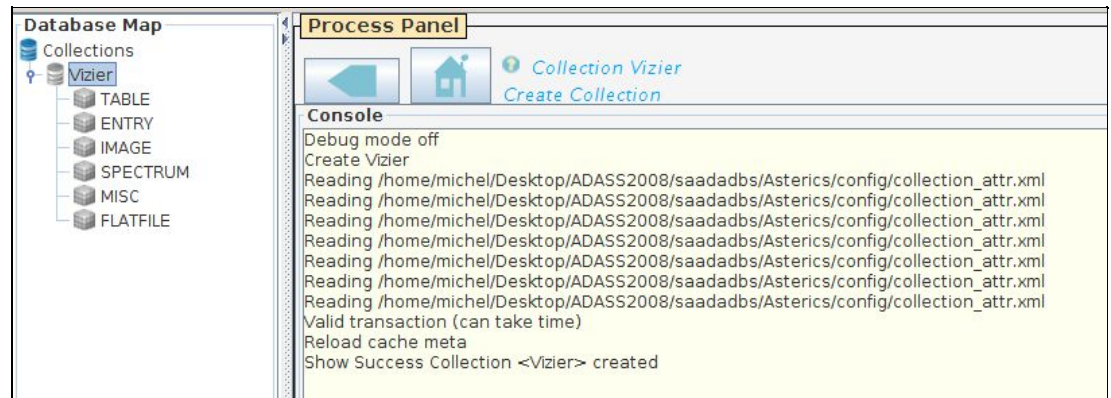

- Download **Saada1.9.build1** from the Saada Web pages
- Follow the online doc (*tutorial>Getting started>install Saada[Tomcat]*)

## Database creation

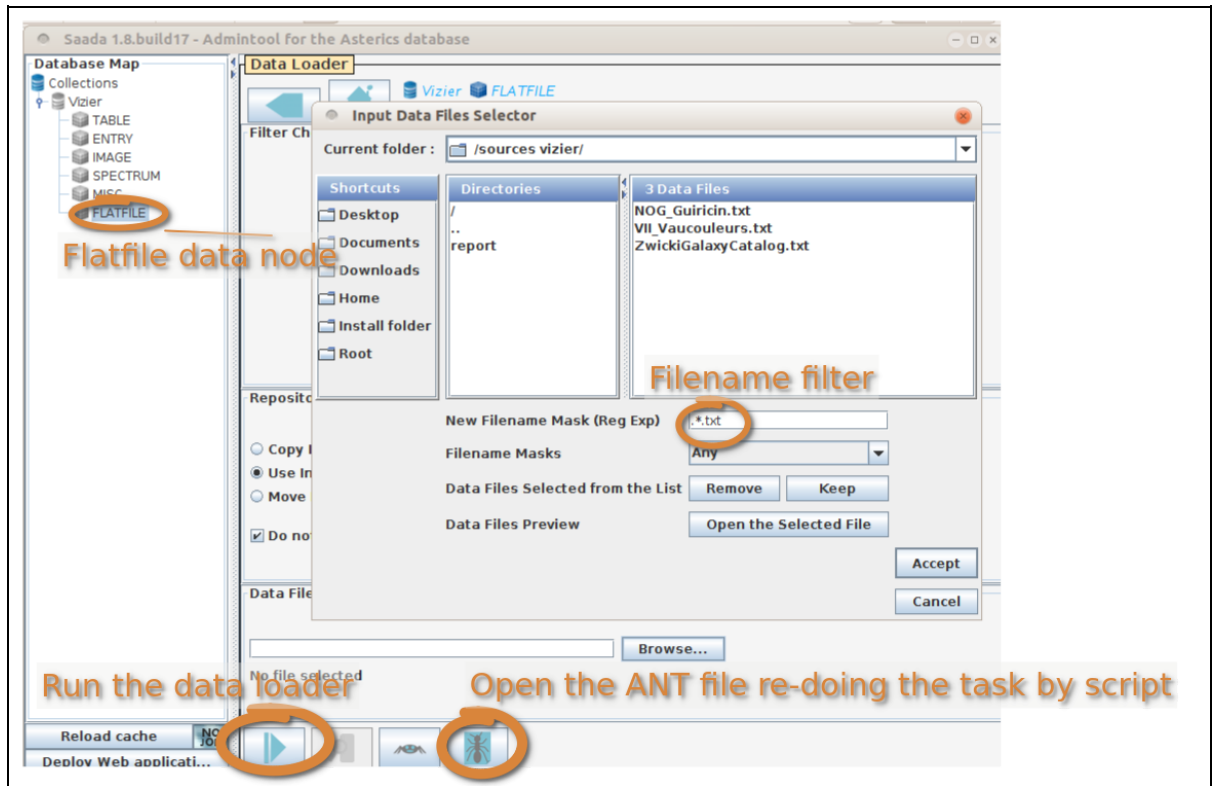

- Follow the online doc (*tutorial>Getting started>create the SaadaDB*)
- Give *Asterics* as *SaadaDB* name
- Choose *SQLite* as DBMS as preference
- Take *Energy/KeV* as spectral unit

## Loading catalogues and READMEs

- Most of the coming tasks are run from the graphical administration tool.
  - Go in `./saadadb/Asterics/bin`
  - Run `./admintool`
- **Creating a data collection:**
  - As the 3 catalog extractions are taken out from Vizier, let's call that collection *Vizier*. (*Admintool > Create collection*)

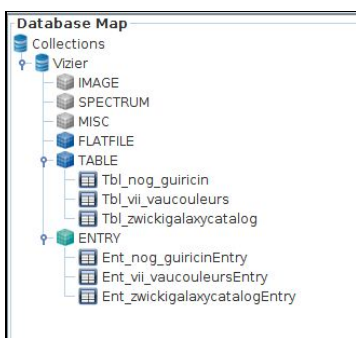

- **Loading the README files**
  - Click on the *FLATFILE* data node
  - Open the *Load Data* panel
  - Open the file browser and go in the *data\_sample/Vizier* directory, filter the \*.txt file and accept.
  - Run the data loader

- **Display ingested data** with a double click on the *FLATFILE* data node
- **Loading the catalogue extractions**
  - Click on the *TABLE* node
  - Open the data loader panel and take *FITS* or *VOTable* as filemask in the file explorer
  - Run the loader.

The header metadata are stored in the *TABLE* node meanwhile the table rows are stored in the *ENTRY* node. As the metadata of these tables are very different, Saada has created 3 different data classes with a name derived from the input file names.

Double click on any node to display the content. There is no data class for the *FLATFILE* node because no data are extracted from flat files.

## Testing the Web interface

- We consider that *Tomcat* is running on port 8080 on *localhost*.
- **Click** on the *Deploy Web App* admin tool button.
- **Connect** <http://localhost:8080/Asterics>. You should retrieve the same data tree as this of the admin tool. Expand it and click on any node to display its top data.

- If you click on a collection level node (*TABLE\_Header* e.g.), you get the data computed by Saada. These data are standardized for all ingested datasets. This interface allows users to select (by position e.g.) data over a set of very different input files.
- If you click on a class level node, you get both collection and class level data.

Asterics Vizier>ENTRY>Ent\_zwickigalaxycatalogEntry

Refine Query

Show 5 entries

Access	Position	Error (arcsec)	namesaada
	12:27:06.00+07:15:00.0 (s)	Not Set	Vizier-Ent_zwickigalaxycatalogEntry12 27 06.0
	12:25:36.00+07:13:00.0 (s)	Not Set	Vizier-Ent_zwickigalaxycatalogEntry12 25 36.0
	12:28:12.00+06:49:00.0 (s)	Not Set	Vizier-Ent_zwickigalaxycatalogEntry12 28 12.0
	12:26:18.00+07:27:00.0 (s)	Not Set	Vizier-Ent_zwickigalaxycatalogEntry12 26 18.0
	12:25:48.00+07:33:00.0 (s)	Not Set	Vizier-Ent_zwickigalaxycatalogEntry12 25 48.0
	12:24:48.00+06:45:00.0 (s)	Not Set	Vizier-Ent_zwickigalaxycatalogEntry12 24 48.0
	12:27:24.00+07:38:00.0 (s)	Not Set	Vizier-Ent_zwickigalaxycatalogEntry12 27 24.0
	12:24:42.00+07:21:00.0 (s)	Not Set	Vizier-Ent_zwickigalaxycatalogEntry12 24 42.0
	12:24:54.00+07:26:00.0 (s)	Not Set	Vizier-Ent_zwickigalaxycatalogEntry12 24 54.0
	12:28:12.00+07:36:00.0 (s)	Not Set	Vizier-Ent_zwickigalaxycatalogEntry12 28 12.0

You can refer to the doc online to get an overview of the Web interface features.

## Loading images

Our goal now is to load a set of 5 EPIC images taken by XMM-Newton. The images have been measured at different periods. Thus they have been processed by different versions of the pipeline and their metadata (keyword set) can vary from a file to another. But we know that these differences are not significant (just a few KWs added or removed) and that all these images can be stored in the same table (or the same *class* with the *Saada* terminology). That can be achieved by using the **ClassFusion** mode.

- To make our storage consistent, create first a new collection named *XMM*
- Select (click on) the *IMAGE* node of the *XMM* collection, open the data loader panel and select the content of the *ImageXMM* directory.
- We have no to tell the data loader to gather all these images in one class
  - Click on *New Loader Filter*
  - Tick the *ClassFusion* radio button
  - Set *EPICImage* as class name and save.
- Run the data loader as for the catalogues.
- Deploy the Web application and reload the Web page.

Asterics XMM>IMAGE>EPICImages

One data class for images

Plot	Access	Position	Size (deg)	names
		12:20:19.35+06:39:38.5 (s)	0.7200 x 0.7200	P0105070
		12:19:19.66+06:40:19.3 (s)	0.7200 x 0.7200	P0111290

## Loading spectra

Our goal now is to load a set of 96 EPIC spectra taken by XMM-Newton. As for the images, we want to use the **ClassFusion** mode. Spectra will also be stored in the *XMM* collection. In addition to this, we would like to keep the energy range of the spectra. The information cannot be extracted from the data file, but we know that the XMM-Newton EPIC camera ranges from 0.2 to 12.5 KeV (to make simple).

- Back to the admin tool
  - Select the *SPECTRUM* node of the *XMM* collection
  - Open the data loader panel
  - Select the content of the *EPIC Spectra* directory.
- Tell the data loader to gather all these spectra in one class:
  - Click on *New Loader Filter*
  - Tick the *ClassFusion* radio button
  - Set *EPICSpectrum* as class name.
- We now have to tell the data loader to set an energy range.
  - Open the *Spectral Range Mapping* form.
  - Set the *mapping* button on *only*. That means that the data loader won't look for a spectral range in the file keywords. It will just apply the user's rule
  - Select *KeV* as unit
  - Put '0.2 12' as range and save

**Spectral Range Mapping** ▾

**only**
 first
  last
  no mapping
 Mapping priority Vs automatic detection

Give a quoted range or the keyword representing the dispersion column (in case of table store).  
Keywords can (must) be dropped from the Data Sample window

- Run the data loader as usual.

- Deploy the Web application and reload the Web page.

One data class for all spectra

Access	Position	Range (keV)
	12:20:18.10+06:41:16.0 (s)	0.2000 - 12.0000
	12:20:18.10+06:41:16.0 (s)	0.2000 - 12.0000
	12:20:18.10+06:41:16.0 (s)	0.2000 - 12.0000
	12:20:18.10+06:41:16.0 (s)	0.2000 - 12.0000
	12:20:18.10+06:41:16.0 (s)	0.2000 - 12.0000
	12:20:18.10+06:41:16.0 (s)	0.2000 - 12.0000
	12:19:20.90+06:38:38.0 (s)	0.2000 - 12.0000
	12:19:20.90+06:38:38.0 (s)	0.2000 - 12.0000

Spectral range set with 0.2 12 KeV

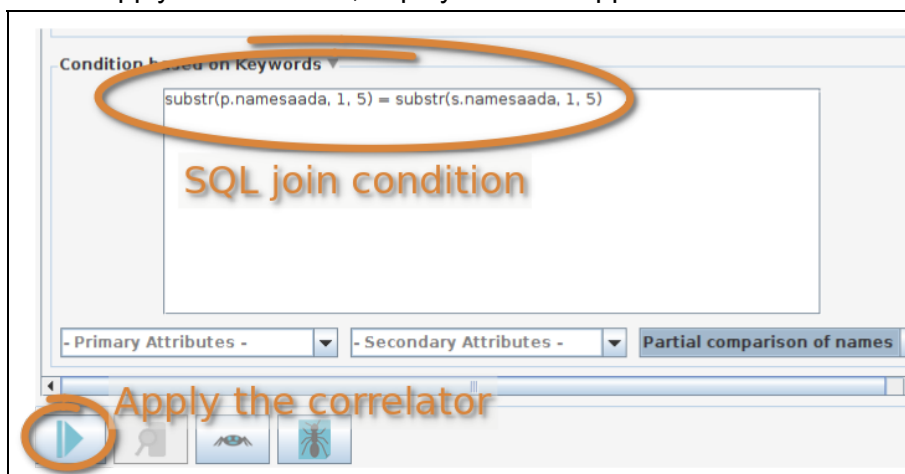

## Linking catalogues and READMEs

The *README* files loaded with the table contain a text description of the catalog they are related to. In this task, we will restore this relationship in order to provide a direct access to the *README* from the catalogs on the Web page. That can be done automatically because both catalogs and *README*s have similar names.

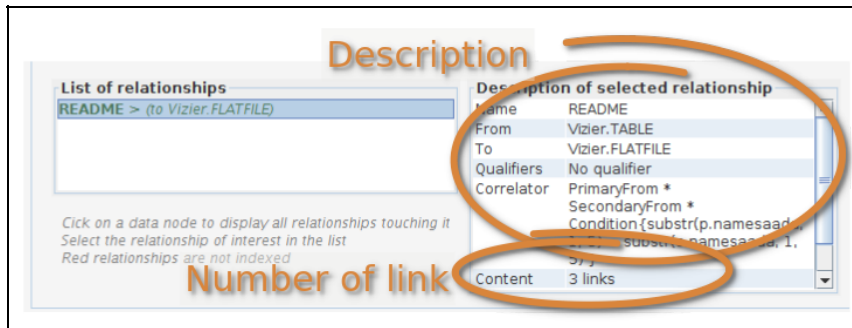

- Select *Vizier.TABLE* on the admin tool data tree. This is the data collection from which the links will start.
- Open the *Manage Relation* panel and click on *New Relation*
- Set *README* as relation name
- Drag the *Vizier.FLATFILE* node, the relation endpoint, to the *To* text field
- Run the command

An empty relationship is created and a popup proposes to populate it. Click *Yes* to open *Correlator Editor* panel

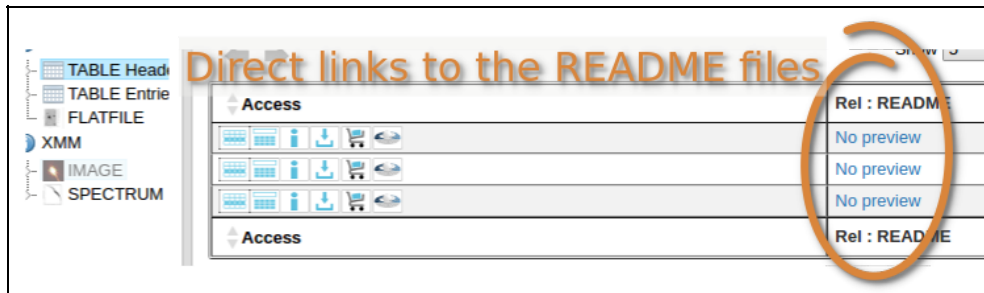

- Open the *Condition based on Keyword* panel
- Select *Partial Comparison of Names* in the *Join operator Templates* menu.
- The SQL fragment shown in the text area can be edited by hand.
- Apply the correlator, deploy the Web application and reload the Web page

The number of links is reported to the panel

On the WEB page, one can now access the README with a simple click .

## Linking images, spectra and sources together

We would like to set pointers from sources to both EPIC spectra and EPIC images. The join condition is now based on the positions. We consider that a spectrum matches a source when the distance in between is lower than 1arcmin. We assume the the image field of view 30 arcmins. Thus, the sources located at less the 15arcmin from an image center will be linked with that image.

Let's start with the spectra:

- On the admin tool, select first the data collection from which the links will start (*Vizier.ENTRY*).
- Open the *Manage Relationships* panel and click on *New Relationship*
- Set *attachedSpectrum* as relation name
- Drag *XMM.SPECTRUM*, the relation endpoint, to the *To* text field
- Run the command
- Accept to populate the relationship and open the *Neighborhood Constraint* panel.
  - Select the closest neighbor (*1st-KNN*)
  - Set the distance threshold at 1 arcmin
  - Run, 3 links are created

Now you do the same for the image with a distance threshold set to 15 arcmin.

- Take *attachedImage* as relation name.
- Deploy the Web application and reload the Web page.
- Look at the *ENTRY* node of the Vizier collection

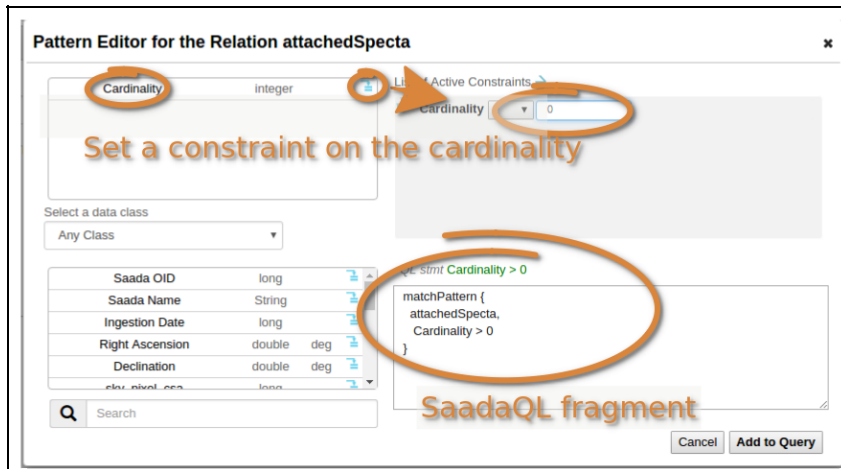

Access	Position	Error (arcsec)	Rel : attachedSpectra	Rel : attachedImage
	12:27:11.20+07:15:48.0 (s)	Not Set	No link	
	12:25:42.70+07:13:00.0 (s)	Not Set	No link	No link
	12:25:54.10+07:33:19.0 (s)	Not Set	No link	No link
	12:24:54.70+07:26:38.0 (s)	Not Set	No link	
	12:24:27.90+07:19:06.0 (s)	Not Set	1 links	

Filtering sources connected with both one spectrum and one image (optional)

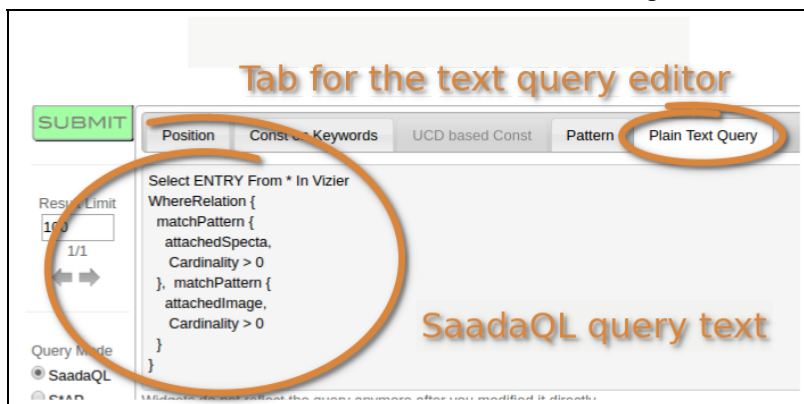

In this exercise we propose to use an advanced feature of *SaadaQL* to filter catalog entries according the data they are linked to.

- Click on the *Refine Query* button to open the query editor

- Click on the *Pattern* tab of the query editor
- Select the relationship *attachedSpectra* from the popup menu.
- Click on *Edit Pattern* to open the pattern editor
  - Set a constraint on the cardinality (number of links)
  - Set the constraint as greater than 0. You can see the valid SaadaQL statement on the bottom right of the panel.
  - Click on *Add to Query*

- Do the same with the relation *attachedImage*.

- If you open the *Plain Text Query* panel, you can see (and modify) the SaadaQL query
- Click on *Submit*.
- Check that only catalog entries with one spectrum and one source are displayed.

VizieR

TABLE Head

TABLE Entry

FLATFILE

XMM

Show 5 entries

Access	Position	Error (arcsec)	Rel: attachedSpectra	Rel: attachedImage
	12:34:02.80+07:42:01.0 (s)	Not Set	1 links	
	12:29:46.50+07:59:58.0 (s)	Not Set	1 links	
	12:24:27.90+07:19:06.0 (s)	Not Set	1 links	

One image and one spectrum per row

1 links

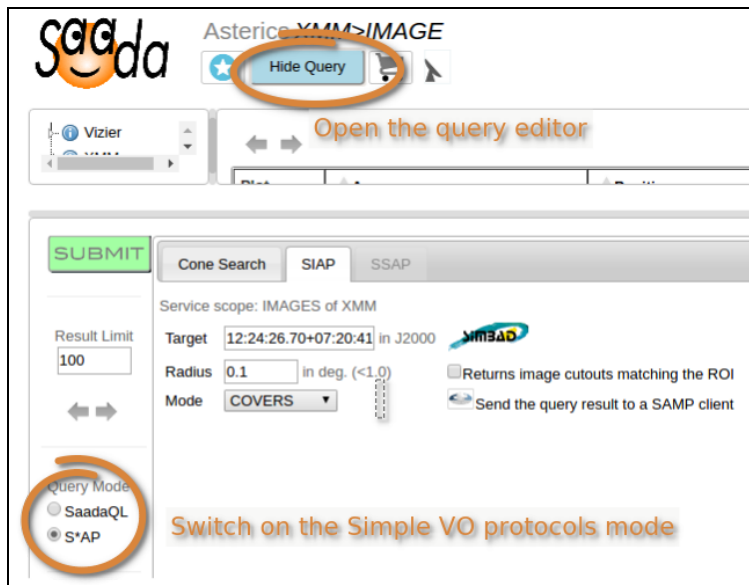

## Publishing a simple service

There is no specific action to run a simple service.

Simple VO queries can be tested from the Web interface.

- Select a data collection (*IMAGE*, *SPECTRUM* or *ENTRY*)
- Open the query form
- Click on *S\*AP* to switch on the VO mode.

- Submit a query . The results comes in a VOTable. It could either be displayed by the browser or downloaded according to your local setup.

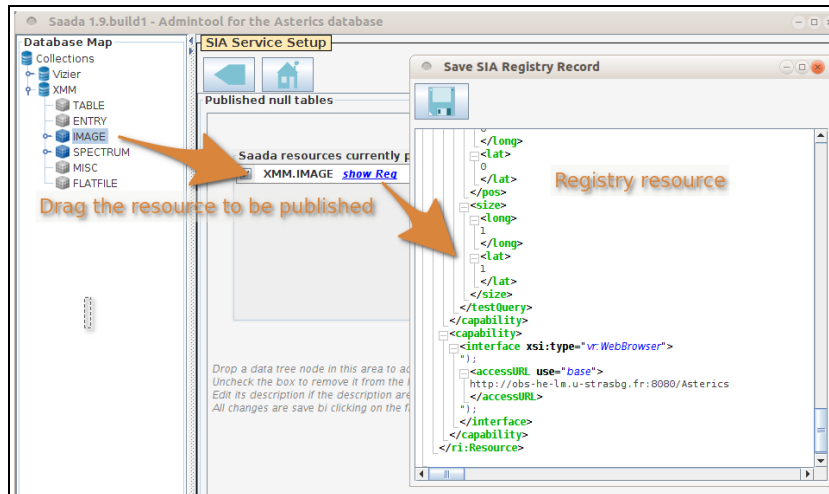

In order to help for the management of the published VO resources, Saada can however keep a reference of the data collection you wish to publish.

- Open the *VO Publishing* panel of the admin tool

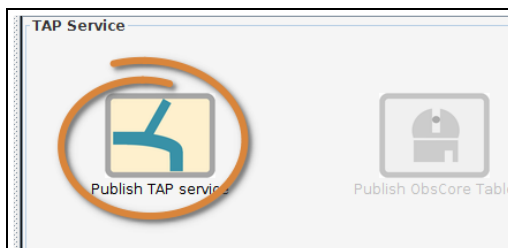

- Select to type of the simple protocol you want to implement
- Drag the data collection you want to publish. The *Show Reg* anchor opens a valid registry record for the data collection.

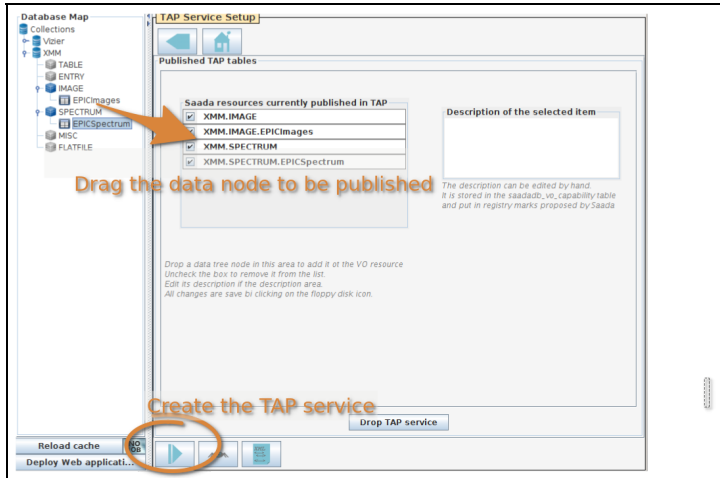

## Publishing a TAP service

Unlike simple services, TAP requires to write specific resources (the *TAP\_SCHEMA*) into the database.

- Open the *VO Publishing* panel of the admin tool

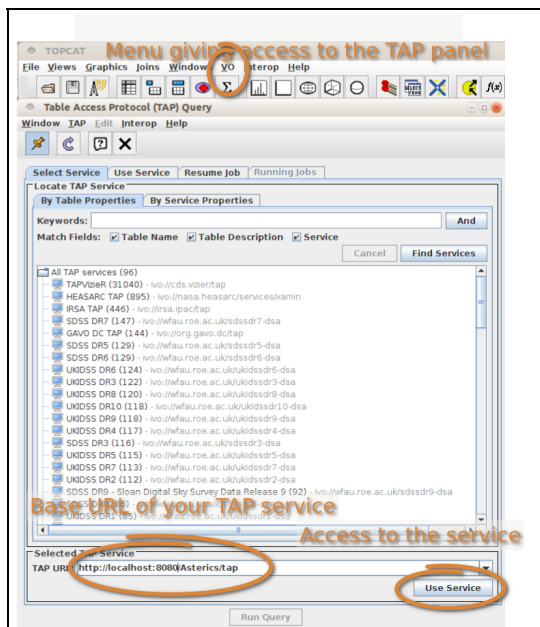

- Open the *Publish TAP Service* panel .
- Drag the data collection you want to publish.
- Execute

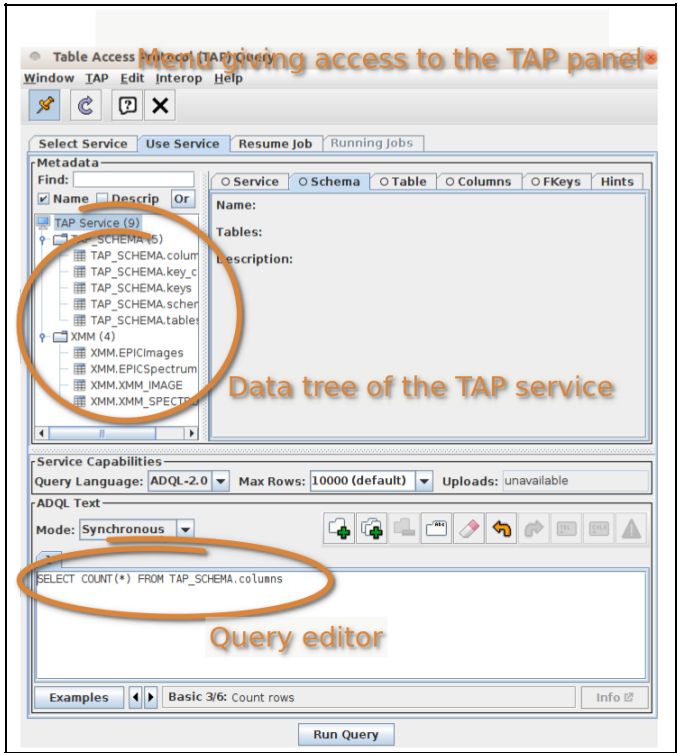

## Accessing the TAP service

Although your TAP service is local, TopCAT can connect it.

- Run Topcat
  - Ex: `javaws -Xmx=1024m 'http://www.star.bris.ac.uk/~mbt/topcat/topcat-full.jnlp'`
- Select *Table Access Protocol* in the VO menu
- Type the service URL
  - Ex: <http://localhost:8080/Asterics/tap>

- Click on *Use Service* and go ahead

## Annex: Saada Scripts

Most of the Saada commands can be run by *Ant* scripts. The Saada distribution comes with an *Ant* task descriptor allowing to run lots of commands by scripts (see *Saada* pages). In addition with this, you can download from the admin tool an *Ant* file for each command you run. Just click on the ant icon.

### Creating the database by scripts

Creating a database by script is less straightforward. The code below is a descriptor of a task doing this for the present database. The *Saada* pages also provide good tips for this.

```
<project name="Creating a DB" default="all">
  <property name="jvm_initial_size" value="-Xms64m" />
  <property name="jvm_max_size" value="-Xmx1024m" />
  <property name="SAADA_HOME" value="-Xmx1024m" />
  <property name="TOMCAT_HOME" value="-Xmx1024m" />
  <property name="jvm_max_size" value="-Xmx1024m" />
  <property name="jvm_max_size" value="-Xmx1024m" />
  <property name="jvm_max_size" value="-Xmx1024m" />

  <path id="saada.classpath">
    <fileset dir="${SAADA_HOME}/dbtemplate/lib/">
      <include name="**/*.jar" />
    </fileset>
    <fileset dir="${SAADA_HOME}/jtools/">
      <include name="**/*.jar" />
    </fileset>
  </path>

  <property name="TOMCAT_HOME" value="/rawdata"/>
  <property name="XCATDBREPDIR" value="/base2/repository/XCATDBi"/>

  <!-- Saadadb initialisation -->
  <target name="saadadb.build" depends="saadadb.init,saadadb.create">
  </target>

  <target name="saadadb.init" >
    <delete dir="${TOMCAT_HOME}/webapps/${SAADA_DB_NAME}" failonerror="false"/>
    <exec executable="dropdb" failonerror="false">
      <arg value="-h"/>
      <arg value="${PSQL_HOST}"/>
      <arg value="-U"/>
      <arg value="${PSQL_USER}"/>
      <arg value="${SAADA_DB_NAME}"/>
    </exec>
  </target>
```

```
<target name="saadadb.create" >
  <copy file="../../env/saadadb.xml" todir="${SAADA_HOME}/config"
failonerror="true" overwrite="true"/>
  <copy file="../../env/collection_attr.xml" todir="${SAADA_HOME}/config"
failonerror="true" overwrite="true"/>
  <copy file="../../env/saadadb.properties" todir="${SAADA_HOME}/bin"
failonerror="true" overwrite="true"/>
  <exec executable="createdb" failonerror="true">
    <arg value="-h"/>
    <arg value="${PSQL_HOST}"/>
    <arg value="-U"/>
    <arg value="${PSQL_USER}"/>
    <arg value="${SAADA_DB_NAME}"/>
  </exec>
  <java classname="saadadb.newdatabase.NewSaadaDB" failonerror="true" fork="true" >
    <classpath refid="saada.classpath"/>
    <arg value="${SAADA_HOME}"/>
  </java>
</target>

<target name="xmode.set">
  <chmod file="${REPOSITORY}/tmp" type="dir" perm="777"/>
</target>
</project>
```
